Ka Tsun Hui

Reflection Summary

The project began with six datasets across finance, e-commerce, real estate, sports, and healthcare; reviewing against my interests narrowed the industries to finance, environment, and entertainment, and four datasets were replaced. The most instructive step was extracting the SPY snapshot myself: plotting IV against strike reproduced the skew, and the Greeks against moneyness reproduced textbook delta, gamma, theta, and vega. With Kaggle unreachable from my machine, I worked from the Kaggle-published Spotify and TMDB datasets via local copies, and the fifth dataset — a FINRA short-interest panel joined with Yahoo Finance prices — was built from official regulatory filings. Key rubric learnings: double spacing, per-section structure with exact labels, genuine data-quality problems, one page of examples. The challenge: five datasets in five to eight double-spaced pages.
